

The stability boundary remains censored

All 96 seed-level cells are stable; every aggregate boundary is $p \leq 0$

	$p=0$	$p=0.05$	$p=0.1$	$p=0.15$
LR=0.0003 R=6	stable	stable	stable	stable
LR=0.0003 R=12	stable	stable	stable	stable
LR=0.001 R=6	stable	stable	stable	stable
LR=0.001 R=12	stable	stable	stable	stable
LR=0.003 R=6	stable	stable	stable	stable
LR=0.003 R=12	stable	stable	stable	stable
LR=0.01 R=6	stable	stable	stable	stable
LR=0.01 R=12	stable	stable	stable	stable

No depth ordering is identifiable at any learning rate.

Machine endpoint $p=0$ is not promoted to an observed boundary.
